I've noticed that Python : sorted(iterable, key=...) returns an OrderedDict? But, we can not use OrderedDict to build an alternative to the built-in sorted(). I wonder if there is a difference between a OrderedDict, and a normal dict, and what is the difference in practice? A: Sorted is smart enough to use the items' comparison function as their key. It even does things like call the keys() function if that's what you provide. OrderedDict is just an implementation detail which happens to use one of your favorite data structure features for its keys. .add(new YLabel("Cluster 1:")); panel.setVisible(true); } public static void main(String[] args) { SwingUtilities.invokeLater(() -> createAndShowGui()); } } class XValuePane extends JPanel { public XValuePane(double value) { super(new GridBagLayout()); setBorder(BorderFactory.createEmptyBorder(0, 10, 0, 0)); Border border = new CompoundBorder(new TitledBorder("X-Values")); add(new JLabel("X-Value:")); add(new JLabel(" " + Double.toString(value)));

If I were to build a new Linux server, is there a common understanding of what the MAJOR and MINOR values SHOULD be? Do these values change for every hardware revision of the hardware? Or is it only based on what I have in my hand, such as the specific CPU and motherboard? I am asking this question due to the fact that it seems that there are not that many common guidelines 6a5afdab4c

When using G-Sonique's T-Soft feature on a long press of one of the main keys to create a long, slow tape-like rolloff. The setting that is most used for recording audio with treble softening such as TV shows, movies and videogames. Explanation & Example: For the past months, I've been using this tool for recording and stacking audio from TV shows and movies on top of each other. The tools allows me to easily fine tune the overall treble softening, so the ends of the tape or audio sounds very smooth. It also allows me to fine tune the presence and frequency of the transients and the high frequencies in the high end of the audio spectrum. I have attached the result of my treble softening in two different settings: without treble softening and with treble softening. For those of you who are new to audio softening, it is something that you just rarely hear on audio. Personally, I like to use it when I'm mixing a group of seperated clips together in a longer recording, such as TV shows. It adds a really nice smoothness and to me, it's the perfect way to minimize distortion and to restore the original treble frequencies of the video source.
