Modeling is essential for simulation development, especially for games that involve the interaction between human and machine. An effective simulation design not only can meet your needs, but also can make your game development easier and cheaper. When developing a simulation, its design should be user-centered. This means the user can directly feel how things are, and how the simulated world responds to their actions. This article will tell you how to design a simple input/output system for your game. I pass the vector to the constructor and it should have its contents. Now i want to print the vector. This is my constructor: Product::Product(int size, int price, vector data){ mysize = size; myprice = price; myvector = data; } Then I have a method which is supposed to print the vector: void Product::print_list(){ ofstream file; file.open("myfile.txt"); file.write(myvector.begin(), myvector.end()); file.close(); } It works perfectly for small size vectors and its printing out all the elements. I was wondering if anyone has seen this before and knows what might be wrong? A: You are passing a vector to the constructor

Macro generator for the MAXQDA program. It offers the option to create macros in a small number of programming languages, including VB, Visual Basic, JavaScript, VB.NET, ASP, ASP.NET, ActiveX, Java, Perl, Shell, Ruby, Java Script, PHP, Tcl, and Visual Basic for Applications (VBA). Each macro is made of an instruction set that includes the name of the programming language, the instruction sequence, as well as a variable. As soon as you start the macro generator, you have to set up macros, for example, in order to add new languages, or the programming and instructions for a specific language. When you run a macro, you can modify and run it again and again with the same parameters, or you can run it in a new context, if you have more than one macro in the program. Each macro is a separate 'object' or 'instance', and can be saved separately. If you save a macro as an executable file, the program will run it from a Macromedia Dreamweaver file without any other file, as well as in the MAXQDA program. When you start a macro in a new context, you can easily change the parameter values and the file name. You can, for example, start a new macro to use a different variable, or to run a macro in a different program. Add: Add a new macro into the program. Remove: Remove a macro from the program. Control: Control the parameters of a macro. Remove All: Remove all macros from the program. Source: Source a macro from a file. Preferences: Preferences for a macro. Import: Import a macro from a file. Export: Export a macro to a file. Save: Save a macro to the specified folder. Delete: Delete a macro. Note: the macros are protected by a password, so the program will warn you if it detects a wrong password. Lingvox, Inc. XLNX, Inc.
