When a user prints out, at a photo shop, original prints of a subject from a negative film or a reversal film having images thereon, the user sends the prints to another photo shop where the images of the original prints are changed into prints having an image size corresponding to a size of an image printing machine, and the prints are again returned to the photo shop where the original prints are reprinted. Such a processing is called reprint processing. In this reprint processing, an original print is not merely changed into a photographic print having a size corresponding to the size of an image printing machine, but the print is modified to provide an image size suitable for a user. In other words, the size and the number of prints sent to a photo shop are changed, and it is necessary to determine a printing order of the prints. In order to determine a printing order of prints, a number of prints must be counted. Conventionally, a number of prints must be counted by manually operating a counter while seeing the prints, which is a troublesome work. Further, in the case where a size of prints is changed, the size must be changed manually while watching the prints.Q: How to check if the loaded data is a value or a color in app script I want to check in my script whether the data in sheet1 is a value or a color. Is there a way to distinguish the data type or is it impossible to do that? This is an example what I want to do: function onOpen

With the fast-forward feature, navigate through drawings and models directly to the latest version. Create a new feature (such as a milestone) based on a previous version. It will automatically detect and generate a new number for the new feature. (video: 3:20 min.) The updated Integrated Development Environment (IDE) now supports the latest version of AutoCAD, as well as other CAD applications. The new application interface and taskbar provide the quickest way to access applications and the taskbar's expanded hot buttons. The application no longer loads until you open it for the first time. Improvements to tables, column widths, and groupings in tables. The coordinate system and option-specific properties for objects. Improvements in annotations, drawing packages, 3D topologies, paper space, and markers. Improvements to geometric dimensioning and tolerancing, non-projection surfaces, and extensions for Non-Project Professional (NPP) and Windows.
