The present invention relates to the field of semiconductor manufacturing, and more particularly, to a method for forming a gate structure. In semiconductor manufacture, complementary metal-oxide-semiconductor (CMOS) devices are formed on a substrate using a standard process flow. In a typical process flow, a gate dielectric is formed over a semiconductor substrate that is doped with either n-type or p-type impurities. Then, a gate electrode, which may include doped polysilicon, is formed on the gate dielectric. Thereafter, a source/drain region may be formed by implanting an impurity into the substrate. The impurity may be either n-type or p-type. For NMOS devices, the source/drain region is formed by implanting n-type impurities, while for PMOS devices, the source/drain region is formed by implanting p-type impurities. The impurity may be implanted using one or more ion implantation processes. A polysilicon liner is typically formed on the sides of the gate structure in order to modify the gate structure's electrical characteristics. A silicide layer is formed on the surface of the polysilicon liner to reduce the electrical resistance of the polysilicon liner. The silicide layer is typically formed by a salicide process that forms a titanium-based or cobalt-based silicide on the polysilicon liner. However, the salicide process may lead to depletion of the polysilicon liner due to formation of titanium silicide on the surface of the polysilicon liner. The depletion of the polysilicon liner may cause electrical shorts between the gate electrode and the substrate.Q: How do I setup a frontend of a braintree server? I have a braintree server up and running, which requires a frontend node.js interface. What is the best way to do this? I see that braintree has created a package for creating a node module to generate such a frontend. However, the instructions are very confusing, and I am not sure what I have to do to make the frontend work. How would I go about this
