Trancite Easy Street Draw V4021Honey Honey is a sweet, sticky substance made by honey bees that are kept on a piece of tree bark, the source of a known type of fungus. Honey is generally used as an end product to attract nectar-feeding animals, or as fuel to provide warmth and energy. Its major components are sugars, other monosaccharides and disaccharides, mostly fructose and glucose but also sucrose. Over 4,000 different compounds have been identified in honey. In European languages, the word for honey has the same root as the word for wax and honeycomb. History Archaeological evidence of human use of honey dates back to 3000

---

BC. In ancient Egypt, honey was associated with the goddess Hathor. Honey was a staple of ancient peoples and used for a variety of purposes. Honey was used to provide energy for food preparation, and in the ancient world, honey was used as currency, a trade good, an offering to other deities, and even as a poison. Due to the hazards of extracting honey from beehives, honey was also considered a sacred gift; such was its cost to the givers that it was called "pera," or price. Honey was introduced to the island of Malta in AD 1400 by Spanish explorers and settlers. When discovered by the Maltese, they called it mal ta'xu (milk of the bee). Farming Honey bees are able to extract nectar from flowers when these flowers contain sufficient glucose or fructose. The amount of glucose in honey is usually more than that of fructose. (Some honey samples may contain equal amounts of both glucose and fructose, or other sugars such as sucrose). Some sources suggest that bees have selective preference for fructose over glucose, which is unusual for animal systems. Honey c6a93da74d
