Typically, these digital data files have been stored on magnetic or optical media. Optical media can be read from and written to using devices that employ laser technology. Recently, technology has been developed to store digital data on the hard disks within computers. This recent development is called "compact disks" or "CD's". A CD, for example, consists of a circular, transparent plastic disk having a diameter of approximately 1.2 inches. The surface of the CD has a spiral pattern of indentations, called "lands", which form concentric circular recording tracks. The spiral tracks are divided into a number of equally spaced sectors. The size of each sector is standardized to be approximately 0.645 mm wide. Accordingly, there are eighty-five tracks in each sector and the tracks are arranged in a spiral sequence. Each track is divided into a predetermined number of addressable units. These addressable units are called "pits" and the number of pits per track is called the "track pitch". The addressable units are arranged in a predetermined sequence. During a read or write operation, the addressable units, or pits, are sensed. As the CD is rotated past a read head
