I've used the Lens tool since it was introduced in Elements 11. The actual brush used to apply the pop effect is a very standard tool with more than 20 options. The one thing I like about this tool is that I can change the color immediately after clicking the brush. Adobe's editing utility also has an ability to gracefully save your work when using the split brushes. I saved a selection of the raw organic color being used in the stop screen. I could apply that color to a variety of areas in the image's selection. This eliminates a problem where you typically save the original image, then make changes and open it up again. Other new features of this release include support for layers groups and layers channels, enhanced undo, and the ability to rename and bulk rename groups and layers, so that you can edit, move, and remove groups and layers quickly. Apple's version of Photoshop has a much more robust Layers palette that makes it easy to create new Layers. • The new support for layers channels is a welcome addition to Elements. The idea is to separate the layer's color and transparency channels so that you can edit the color with the color fx, and the

opacity with the Transparency fx. The new command Center Create Photo Layers Move can also be used to create and move layers. The Layers palette in Photoshop Elements is limited, so to move, duplicate, or delete layers, you have to do so from within the Channels palette. Thanks for playing along with me so far. Don't forget that we posted the original review of this software last week - you can read that here. If you missed this week's update, you can check out the new post and feel free to subscribe to the RSS feed.
