Electro-magnetic Inkjet (EMI) printing is a promising technology for high-resolution digital printing onto various substrates including flexible materials such as paper. An optical feedback and closed-loop signal are provided by image sensors placed on the opposite side of the paper. Here, we demonstrate EMI printing of color imagery and wide-format graphics directly onto 8.5 x 11-inch-sized paper at 4 pages per second (ppm) printing speed. were collected in Leipzig at various times in the morning and showed a significant increase at 13,000 rpm/min from 1 to 4 h, but not at 8 h, when some of the extractable components appeared to be aggregated ([Table 2])(#tbl2){ref-type="table"}). However, the increase was not statistically significant and to minimize this effect the additional mixing were collected at the start of the time intervals. Such a significant increase in extractable components was not observed for thermal energy or the enthalpy of the paste, and it would be difficult to predict the effect on the pulverization and hence to predict the generation of particulate matter which can be expected from this phenomenon. Such an increase in extractable water may also be an indication that the rhizomes were ageing and beginning to soften and become more digestible. Thus, it would be important to determine the levels of a wide range of medicinal constituents and metabolites of the *Liriope platyphylla* rhizomes before and after their medicinal use. Previous workers have reported that *Liriope* has a high aromatic content but relatively low in alkaloids ([@b17]). The rhizomes of *Liriope* from Northeast China have also been reported to
